Enquiry stage -

Add all project enquiry to CRM so we can filter it and see and pass on the access to sales team to follow up for closer

Add quotations to enquiries so we can include our products and prices in the CRM. This allows us to quickly see the last quoted price for any customer and compare prices or cost changes with all terms and conditions across other customers.

Send reminders via email for quotations sent, or have the sales team contact them to check.

For any quotation requiring site measurement, the backend team must notify the Project team. The Project team should then obtain the necessary documents and contact details for the site to arrange measurement and upload all documents, including the floor plan and photos.

Project Manager -

All confirmed and enquiry stage leads, the sales team, and the back-end team will provide information to the Project Team; these are the projects requiring your action.

The project manager will assign a project in-charge for every project to handle site measurement, photos, and elevation and upload them.

Once they take measurements, they will add instructions regarding surface preparation needed from our side, such as whether a ladder or scaffolding is required for application etc.

Design Manager

The sales team will send a notification to the Design Head for an upcoming project requiring design work.

The Design Head will download all project information, such as floor plans, site measurements, site photos, the project brief, client details, the company brand manual or look and feel documents reference pictures to understand the entire project.

The sales team will have the option to either set the timeline according to the client's need or keep it open and decide the timeline after discussing current projects with the Design Head to determine the delivery date.

Once the Design Head has full clarity, he will assign the job to the team, deciding who will work on the project, along with all related documents and his concept and timeline, so the team gets notified and starts working within that timeline. If we fail to deliver on time or need additional time, there should be a request button so the sales team gets notified and can ask the client for more time.

Two option designer will have two options: upload a daily worksheet (if possible, we can sync this with software or do it manually), and once the project is completed, they upload the design version. First, they will upload a mood board for client feedback; the client will provide feedback, and if changes are needed, we can add comments. If there are no changes they can start working. Like this, they can upload every presentation version for feedback and approval until the final version is uploaded.

Designers will have multiple projects to work on; we need to calculate the time spent on every project. My suggestion is: is there an option where, whenever designers are working they open the CRM, select the project, and start the timer, and when the work is done they enter the end time so the system calculates the overall time spent by the individual? Or is there any other way?

We need to integrate an internal team chat option and quick file sharing with the team so that if anyone has any doubt, they can discuss it in the chat.

Implement an internal chat system for all employees. If any department needs assistance, they can ask questions, the responsible team can reply, and all conversations are documented so no mistakes happen. If a team member still makes a mistake afterward, we can identify whose fault it was and who is responsible.

Is it possible to create groups for chat and file transfer internally and externally if we want to add the client for day-to-day review?

Once everything is approved, the team will upload the final design version and a link to download print files. Since these files are heavy, we need to discuss whether we upload all the files in the CRM or just provide a link.

Production team

Operational manager and incharge will get notification files are ready for sample prints and final production

The in-charge will download the files and give them to the pre-press team to work on. If there are any sample requests, the in-charge will seek approval for sample printing from the sales team. Once the sales team approves, they can send the files for production. Once samples are approved they will start final production. The backend team will grant access to check the project quantity so they can match it, ensuring production does not exceed the PO quantity.

Once production is done, the team will assign a quality check person to verify all production quality and upload a record confirming everything is okay. If there is a problem, they will highlight it and upload images with details about the issue requiring re-production. Once everything is okay, they dispatch the material to the location. They will also ask the accounts team for the invoice.

The in-charge will assign the applicator team for the installation job. The applicator will download the file to check what applications they need to perform and the material specifications.

Before starting work, they will complete a questionnaire indicating that all surfaces are neat and clean for installation, dust-free, storage space is available for material, all material was received in good condition, and all material quantity is fine with nothing missing. Once the form completion is done they start the application and take pictures of the completed walls and glass. They upload photos with the same name given in the design file and measurement sheet. Lastly, we can download a floor-wise, consolidated deck.

once job is done they will do certification with client and upload the copy in crm

also they will fill once more foam post application indicating everythning is fine no snags

Sales team

The head will check all inquiries and assign the sales team for follow-up, checking all enquiry statuses—how many we lost, won, and are currently discussing.

For all lost projects, the sales team will provide a valid reason for why the project was lost.
